PRAGNASRI BANDI

Software Engineer — TypeScript · React · Python · Android · ML · SQL · REST APIs · Full Stack
pragnasrib24@gmail.com · +1 978-606-5933 · New Hampshire · F1 OPT · linkedin.com/in/pragnasri-bandi-760b86367 · github.com/pragnasri24

PROFESSIONAL SUMMARY

Software Engineer (F1 OPT, May 2026 CS graduate from UMass Lowell) with hands-on experience building full-stack web applications, Android mobile apps, REST API backends, and machine learning pipelines. Demonstrated ability to ship production software — SupportAI is live at support-ai-sable.vercel.app — and to collaborate effectively on cross-functional team projects. Strong foundation in Python, TypeScript, React, SQL, Android (Java), and machine learning with scikit-learn. Comfortable working across the stack and picking up new technologies quickly.

TECHNICAL SKILLS

Languages: TypeScript (primary), Python, JavaScript, Java (Android), SQL, PHP, Kotlin (concepts)

Frontend: React.js (production), HTML5, CSS3, Android XML layouts, responsive design

Backend & APIs: Node.js/Express.js, FastAPI, PHP REST APIs, MySQL, PostgreSQL (Prisma ORM), JWT authentication

Machine Learning: scikit-learn (Logistic Regression, KNN, Random Forest), NumPy, Pandas, Matplotlib, feature engineering, model evaluation

Mobile: Android development (Java/Kotlin), Android Studio, Retrofit/HttpURLConnection for API calls, XAMPP local backend

Tools: Git, GitHub, Jupyter Notebook, VS Code, Android Studio, Postman, phpMyAdmin

EXPERIENCE

Student Worker — UMass Lowell — Tsongas Center

May 2025 – May 2026

JavaScript · SQL · Enterprise POS · APIs · RDBMS · Access Management · Testing

- Developed and maintained internal tools and workflow automation using JavaScript, SQL, and Excel-based automation to streamline cashier operations and inventory management
- Configured, integrated, and supported enterprise Point-of-Sale (POS) applications ensuring reliable software performance during high-volume campus events
- Built and enhanced data-processing workflows — validating inventory transactions, generating operational reports, and improving data accuracy across relational database-driven systems
- Developed SQL queries and reports to monitor inventory levels, reconcile transactions, and support data-driven operational decisions
- Implemented secure user access management — configuring user accounts, permissions, and authentication settings for internal operational systems
- Performed functional testing, debugging, and validation following software updates to ensure application stability
- Created technical documentation, workflow diagrams, and support procedures to standardize system maintenance

PROJECTS

SupportAI — AI Customer Support Platform (LIVE) | *TypeScript · React.js · Node.js · Express.js · PostgreSQL · Prisma ORM · JWT · Socket.IO · Vercel*

- LIVE at support-ai-sable.vercel.app (GitHub: github.com/pragnasri24/SupportAI) — full-stack production platform built and deployed end-to-end: React/TypeScript frontend, Express.js REST API backend, PostgreSQL with Prisma ORM, JWT/RBAC authentication, real-time Socket.IO bidirectional communication, and Vercel/Render/Supabase deployment
- Diagnosed and fixed a Socket.IO race condition under concurrent load — multiple agents receiving the same ticket update causing duplicate state transitions; resolved with idempotency keys and atomic database transactions
- Sole developer — owned the project from design through production, maintaining it with real users and real traffic

Human Activity Recognition | *Python · scikit-learn · NumPy · Pandas · Matplotlib · Jupyter Notebook*

- Built a machine learning pipeline to classify human physical activities (walking, sitting, standing, and more) using accelerometer and gyroscope sensor data from smartphones and smartwatches — group project with Gireeshsai Kalluri (GitHub: Gireeshsai12/human-activity-recognition)
- Implemented full ML pipeline: data preprocessing and normalization, feature engineering from raw sensor signals, model training (Logistic Regression, KNN), and performance evaluation with accuracy metrics
- Demonstrated applied machine learning fundamentals — Python/Pandas for data manipulation, scikit-learn for classification, Matplotlib for results visualization, and Jupyter Notebook for reproducible analysis

Android Student Information System | *Android (Java) · PHP · MySQL · XAMPP · Retrofit · Android Studio*

- Built an Android mobile application connected to a MySQL database through PHP REST APIs — group project implementing a full Student Information System (GitHub: Gireeshsai12/Phase3)
- Features implemented: student/instructor/admin login with authentication, course browsing and registration (capacity-limited sections), student transcript with GPA calculation, threaded discussion boards with TA moderation, and course evaluation with grade access control
- Android communicates with PHP backend via HTTP requests (Retrofit/HttpURLConnection), PHP processes requests and interacts with MySQL, and JSON responses are rendered in the Android UI — complete full-stack mobile system

EDUCATION

University of Massachusetts Lowell May 2026

Bachelor of Science in Computer Science · GPA: 3.36/4.0 · Relevant: Software Engineering, Machine Learning, Database Systems, Algorithms & Data Structures, Mobile Development, Web Development

F1 OPT — May 2026 CS graduate · STEM OPT eligible · SupportAI LIVE: support-ai-sable.vercel.app · github.com/pragnasri24
